Approved For Release 2008/08/210 CIA-RDP75B00285R000100220004-3 SMARK PROTECTION SCREEN ASSEMBLY

- I. Assembly. The complete assembly shall consist of a shark protection screen packed in a scaled coated fabric container with an easy opening feature as shown in Figure 2.
- 2. Materials. The materials used in the fabrication of the shark protection screen shall conform to the requirements specified herein.
- 2.1 Screen Materials. The fabric used to construct the inflatable tubes, screen body and container shall be a nominal 5.4 ounce/sq.yd. neoprene coated nylon fabric, (Chemical Rubber Company's No. 2998). Tapes used in construction of the screen assembly shall be lightweight neoprene gum tape or fabric tape.convenient to the manufacturer.
- 2.2 Cement. Neoprene cement conforming to MIL-A-5540 Class 1, 2 or 3 shall be used to construct the shark protective screen. Color of the cement shall approximately match non-specular sea-blue No. 35042 of FED-STD-595, CHANGE.
- 2.3 Oral Inflation Tube. An oral inflation tube assembly similar in design to that shown in Figure 3, shall be provided. The tubing material that connects to the injet of the oral valve may be plastic and the internal diameter of the plastic tubing shall make a snug fit with the outside diameter of the oral valve. The oral valve shall be secured to the inflatable tubes by a 40 durometer angle flange Pam Company Part No. 601 as shown in Figure 3. The angle flange shall be secured to the inflatable tubes by cementing. Tubes shall be located approximately as shown in Figures 1 and 3.
- 2.4 Oral Valve. An oral valve, such as the Halkey-Roberts No. 40-AL, shall be used in that the open-close feature of the valve shall be a screw type. The oral valve shall be attached to the angle flange; Pam Part No. 601, as shown in Figure 3. The angle flange shall be secured to the inflation tubes as shown in Figure 3.
- 2.5 Oral Tube Holder Loop. A holder loop of the same material as the inflatable tube shall be provided as shown in Figure 3.
- 2.6 Construction.

2.6.1 Shark Protection Screen.

- a. The shark protection screen assembly shall be water tight. The inflation portion of the screen shall be air tight.
- b. The number of seams to construct the shark protection screen shall be held to a minimum. The exterior surface of the completed screen shall present a smooth, watertight surface with no sharp corners, edges, projections, or loose material.
- c. The inflatable portion snark protective screen shall be constructed to the exproximate measurements indicated in Figure 1. Inflatable tube size shall be measured when the tubes are inflated to 1 psig air pressure.

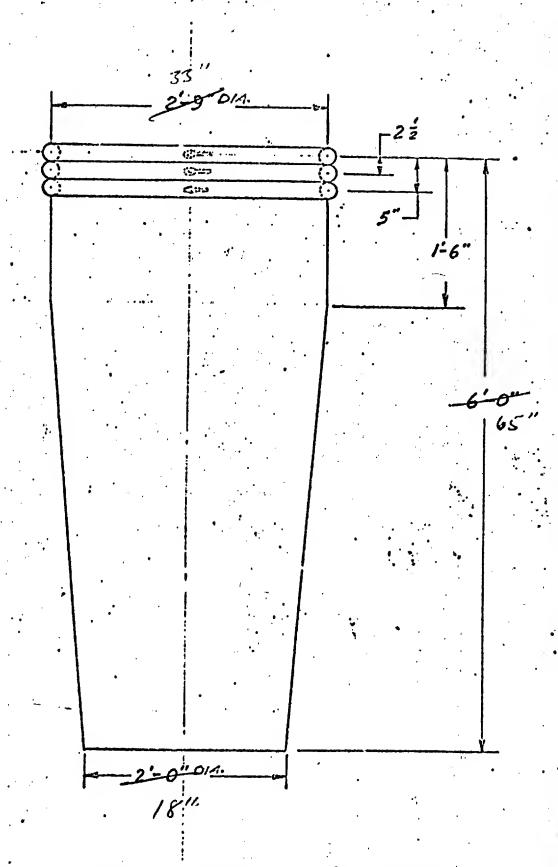

- d. Seem construction of the inflatable portion shall be of the conventional type or at manufacturer's choice to achieve the requirements of b. above. However, the screen body seems shall be scaled on the outside with 1 inch wide tape.
- 2.6.2 Shark Screen Container. A container shall be provided for each shark protection screen. The inflatable tubes shall be deflated to vacuum and the screen assembly shall be folded and compressed to make the smallest possible package before installing in the container. The containers shall be provided with two 1/4 inch diameter vent holes as shown in Figure 2 to provide relief of entrapped air at high altitudes. The container shallmake a tight fit over the enclosed screen so as to prevent excessive bulging of the container from expansion at altitude. The container shall be sealed with a 1 inch wide cemented tape with a 2 inch long pull tab to permit opening.
- 2.7 Package Size. The maximum size of the shark protection screen sealed within the container shall be 6"x5"x1". The manufacturer is encouraged to minimize the package size.
- 2.8 Color. The color of the chark protection screen (inflatable tubes, screen body and container) shall approximately match non-specular sea-blue No. 35042 of FED-STD-595. The color be dull and lusterless.

100220004-3

Approved For Release 2003/08/21 : CIA-RDP75B00285R000100220004-3 The fear of shark attack is ever present for downed air-

men and other castaways in the warm-ocean areas of the world. SHARK SCREEN, a new idea in shark deterents, is designed to eliminate this fear. It is a large bag made of a thin, strong, very light material, with inflatable collars at the top. When not in use, the device folds into a small package to be carried with a life vest or other survival gear.

In the water, the collars of SHARK SCREEN are inflated orally, two to three breaths being required for each. The castaway then climbs inside and scoops water into the bag by pushing down and out on the top and completely extending the bottom.

Safely inside the water-filled SHARK SCREEN, the occupant is completely concealed, From the outside, the underwater portion of the SHARK SCREEN is a large, solid-looking, bulky object which conceals dangling arms and legs and retains blood or other substances likely to stimulate a shark's olfactory system and heighten the possibility of attack.

SHARK SCREEN has been tested against several species of dangerous sharks in both the Atlantic and Pacific Oceans, and has proved to be the most effective shark attack deterrent yet tested. The tests were conducted under contract by Cornell University and the University of Hawaii, with the supervision of Perry W. Gilbert, Ph.D., and A. L. Tester, Ph.D. Dr. Gilbert is chairman and Dr. Tester a member of the Shark Research Panel of the American Institute of Biological Sciences.

Of the several colors tested, dark, dull tones were approached much more reluctantly by sharks seeking bait than were lighter-colored, more reflective ones. The inflatable collars can be brightly colored for visibility and to aid rescue.

Approved For Release 2003/08/21 : CIA-RDP75B00285R000100220004-3

Approved For Release 2003/08/21: CIA-RDP75B00285R000100220004-3 When the SHARK SCREEN was evaluated at the Naval

Missile Center, Point Mugu, in Spring 1969, its value as survival gear was found to include use as a sleeping bag, pup tent, lean-to, stretcher, and solar still.

The work on SHARK SCREEN originated at the Naval Ordnance Test Station, China Lake, California. In July 1967, research in shark deterrents was transferred to the Naval Undersea Research and Development Center, created following a reorganization of Navy laboratories. Technical support is being provided from the Center's Independent Exploratory Development and Exploratory and Foundational Research funds.
